

## **Reproduction and the Autonomic Nervous system, also known as the Neurovegetative Nervous System.**

*"The intelligent use of the neurovegetative system will one day constitute the most important part of the art of medicine"*  
-- Von Hering

As elsewhere mentioned, Procreation is a mysterious event inaccessible to our present human understanding and scientific research investigations.

The present scientific view considers procreation as the result of a complex of regulatory interplay between the informative signals travelling along the neural pathways, the circulating hormones and the neurotransmitters secreted by the hypothalamic and the pelvic glandular reproductive structures. This feed-back interplay is mediated by the autonomic or neurovegetative nervous system and takes place in a pulsatile and cyclic manner. Its mechanism is scientifically still poorly understood.

The presence of the A.N.S. is present in every minute part and cell of our organism. Any interference, functional or organic, along the neural reproductive pathways of the A.N.S. and any circulatory obstacle in the transportation of blood can interfere with the normal process of procreation. Any chronic disease, including abnormalities in the intestinal flora, any scar and any kind of abnormal activity along the A.N.S. can become an interference field capable to disturb the process of procreation. Chronic anxiety, rage, fear, panic depression and other emotional states can also be the source of interference fields and generalized and autonomic sympathetic hyperactivity.

The A.N.S. is also the mediator of light and other forms of energy entering into our organism. Its intervention in the interplay between the spiritual and the material forces, working in our organism, cannot be excluded.

In conclusion infertility, never mind if organic or functional, is always accompanied by autonomic dysfunction. Therefore, the A.N.S. plays a important place in the treatment of infertility.

The Eumedica Swiss Center is adequately medically equipped for the diagnosis and treatment of interference fields, as well as for the evaluation of the energetic status in the reproductive system and the entire person.
