

The reflexotherapy

Pregnancy to take place requires good communication and cooperation between the single parts composing the reproductive system.

Any kind of blockage, functional or organic, along these communicative pathways could prevent pregnancy.

Restoration of functional communication is sometimes possible by reflexotherapies of specific body's areas.

Like for the traditional Chinese medicine, also for modern medical science, the various parts of the human body are in contact with each other by reflection. The so-called reflex zones of Head, scientifically recognized for years, are an example: liver and gallbladder problems can be felt, respectively, in the right eye and right shoulder. On the same way pelvic and abdominal disorders are reflected in dermatomes and myotomes scattered along the spine.

According to Traditional Chinese Medicine, the whole human body is reflected in the auricle and in many other parts of the body, such as in the face, hand and foot. Recent research conducted at the University of Boston, reflex zones also exist in the mucosa of the nasal cavity, and exactly in the areas innervated by the sphenopalatine ganglion of the autonomic nervous system. According to these U.S. studies, there is even a close relationship between the olfactory nerve endings in the nasal cavities and the organs of reproduction. Based on these studies, stimulation of the reflex zones of the nasal cavity may be indicated in certain cases of infertility.

The reflex therapy is part of the multifaceted program of Medically Assisted Natural Procreation practiced at the Eumédica Swiss Center of Lugano.

Particular emphasis is given to the reflex therapy of the nasal cavities for particular commissions with the autonomic nervous system of the brain and the pituitary gland that rests right on the cribriform plate that separates the nasal cavity from the pituitary.
